

Conditions for the Representation of a Harmonic
Function by Green's Formula in a Multiply Connected Domain

39-44-2-5/10

where $u(\zeta)$ is an arbitrary function on Γ which is summable with regard to $\omega(E, z)$, it is necessary and sufficient that $u[\alpha(t)]$ admits in the circle the representation by the Poisson - Lebesgue integral

$$u[\alpha(t)] = \frac{1}{2\pi} \int_0^{2\pi} u[e^{i\theta}] \frac{1 - r^2}{1 + r^2 - 2r \cos(\theta - \varphi)} d\theta, \quad t = re^{i\varphi},$$

$$\alpha(re^{i\varphi}) = z.$$

Besides of this theorem 6 further theorems are proved. They all contain criteria for the representation of a harmonic function by Green's formula. Although this problem of representation was already considered in detail in a much more general form on Riemannian surfaces by Parreau (Ann.Inst. Fourier 3, 1951), the present criteria of the authors seem to be more useful for the applications. There are 6 references, 3 of which are Soviet, 1 Finnish, and 2 American.

AUTHOR: TUMARKIN, G. Ts., KHAVINSON, S. Ya. 42-1-6/13
 TITLE: On the Definition of the Analytic Function Class E_p in
 Multiply Connected Domains (K opredeleniyu analiticheskikh
 funktsiy klassa E_p v mnogosvyaznykh oblastyakh)
 PERIODICAL: Uspekhi Matematicheskikh Nauk, 1958, Vol. 13, Nr. 1, pp. 201-206 (USSR)
 ABSTRACT: Let G be an n -tuply connected domain with the boundary

$\Gamma = \sum_{k=1}^n \gamma_k$, where none of the components γ_k degenerates in
 a point. Let Γ^i be the boundary of G^i , $G^i \subset G$. Let $z = \varphi(w)$
 denote the conformal mapping of G onto a canonic circular
 domain K .

Definition: A function $f(z)$ analytic in G belongs to the class
 $E_p(G)$ with $p > 0$ if there exists a sequence $\{\Gamma^i\}$ such that for
 $i \rightarrow \infty$ the domain $G^i \rightarrow G$ and

$$\lim_{i \rightarrow \infty} \int_{\Gamma^i} |f(z)|^p |dz| < \infty.$$

Card 1/2 Theorem: In order that $f(z) \in E_p(G)$ it is necessary and

On the Definition of the Analytic Function Class E_p in
Multiply connected Domains

42-1-6/13

sufficient that the function $|f[\varphi(w)]|^p |\varphi'(w)|$ subharmonic
in K has a harmonic majorant in K .

Theorem: In the domain G , for all classes E_p there exists a
universal (i.e. for all $f(z) \in E_p(G)$ common) analytic sequence
of contours $\{\Gamma^i\}$ which converges to Γ and for which

$$\int_{\Gamma^i} |f(z)|^p |dz| < C(f) \quad (i=1,2,3,\dots).$$

5 Soviet and 3 foreign references are quoted.

SUBJECT USSR/MATHEMATICS/Theory of functions
 AUTHOR TUMARKIN Z.Z.
 TITLE On Cauchy Stieltjes' integrals.
 PERIODICAL Uspechi mat. Nauk 11, 4, 163-166 (1956)
 reviewed 12/1956

CARD 1/2 PG - 425

As is well-known, the integral

$$(i) \quad \frac{1}{2\pi} \int_0^{2\pi} \frac{e^{i\theta} dS(\theta)}{e^{i\theta} - z}$$

(where $S(\theta)$ is a complex-valued function of bounded variation) defines a pair of analytic functions f_1 and f_2 , from which f_1 is analytic in the unit circle and f_2 is analytic outside of it, where $f_2(\infty) = 0$. The author investigates the conditions which must be satisfied by two functions in order that they are representable by a Cauchy-Stieltjes' integral. Two theorems are proved:

1. Let $f_1(z)$ be analytic in $|z| < 1$ and $f_2(z)$ be analytic in $|z| > 1$; $f_2(\infty) = 0$.

In order that these functions can be represented by an integral it is necessary and sufficient that there exists a $C > 0$ such that for all r ($0 < r < 1$) the inequation

Uspechi mat. Nauk 11, 4, 163-166 (1956)

CARD 2/2

PG - 425

$$\int_0^{2\pi} |f_1(re^{i\theta}) - f_2(\frac{1}{r}e^{i\theta})| d\theta < C.$$

is satisfied.

2. In order that a function $f(z)$ being analytic in $|z| < 1$ can be represented by (1) it is necessary and sufficient that there exists a sequence $\{\pi_n(\theta)\}$ of linear combinations of the system of functions $\{e^{-ik\theta}\}$ ($k=1,2,\dots$) for which

$$\lim_{n \rightarrow \infty} \int_0^{2\pi} |f(r_n e^{i\theta}) - \pi_n(\theta)| d\theta < \infty$$

where $\lim_{n \rightarrow \infty} r_n = 1$ and $\pi(\theta) = a_1 e^{-i\theta} + a_2 e^{-2i\theta} + \dots + a_m e^{-mi\theta}$.

AUTHORS: Tumarkin, L. A., Toptygin, L. A.

TITLE: The Basic Trends in the Automation of Chemical Workshops at Coke-Chemical Plants

PERIODICAL: Zhurnal vsesoyuznogo khimicheskogo obshchestva im. D. I. Mendeleeva, 1960, Vol. 5, No. 1, pp. 61-67

TEXT: The coke-chemical industry will be automated and mechanized during the next few years. Several measures are proposed in the article. The primary cooling of the coke gas should ensure the reduction of its temperature to 30-35°C under all meteorological conditions. Solid naphthalene will be eliminated from the surface of pipes by heating them automatically to the melting point of naphthalene. The sulfate separation can be automated in the existing equipment by avoiding the periodic dissolution of deposits on the walls of the saturator and installing continuous washing of the inner walls by mother liquor with an acidity of 12-15%. The automation of the benzene-scrubber department should ensure maximum extraction of benzene hydrocarbons. The principal difficulties in this respect are: the presence of many independent variables affecting the process of benzene sorption from coke gas; the deposits of resinous substances

Card 1/3

S/063/60/005/001/003/009

The Basic Trends in the Automation of Chemical Workshops at Coke-Chemical Plants

on the surface of the heat-exchange and collecting apparatus. The automation of the benzene-scrubber department cannot be realized without improving the quality of the absorbing oil. The supply of steam to the benzene column for distilling the benzene hydrocarbons from the absorbing oil should be controlled automatically. Hydrogen sulfide is collected from coke gas in continuous operations which can be automated easily. An exception is only the absence of an installation for the processing of substances from the solution of sulfur purification which cannot be recovered. A transducer must be developed which should indicate the content of hydrogen sulfide in the solution after regeneration. In the tar distillation workshop the continuous averaging of the different tar grades must be organized. The tar distillation can be automated by a system developed for oil refineries. The accurate separation of anthracene fractions can be solved by automation of the sprinkling of the upper part of the pitch column by the absorbing fraction. A continuous system for the washing of the naphthalene fraction and the processing of the anthracene fraction in continuously operating crystallizers were developed by the Ukrainskiy uglekhimicheskiy nauchno-issledovatel'skiy institut (UKhIN) (Ukrainian Coal-Chemical Scientific Research Institute) and Giprokoks. In the rectification of crude benzene all batch operations, e. g.,

The Basic Trends in the Automation of Chemical Workshops at Coke-Chemical Plants

the washing of the benzene fractions by sulfuric acid and the production of toluene, must be eliminated. The neutralization of the benzene vapors must be automated by maintaining a temperature difference of 3-4°C between the liquid alkali and the vapors. Attention must be paid to corrosion-resistance of the materials employed. The automated installations will pay off within 2-2.5 years. There are 4 block diagrams.

TITLE: Crushing of Coals for Coking. (Izmel'cheniye ugley dlya koksovaniya).

PERIODICAL: Koks i Khimiya, 1957, No. 8, pp. 7-10 (USSR)

ABSTRACT: The importance of crushing gas coals separately from the other blend components in order to decrease the proportion of dust in the blend is discussed and supported by the experimental evidence obtained on the Bagleyskiy Coke Oven Works. Crushing experiments were carried out with a blend of the following composition, %: G-16, Zh-44, K-22 and OS-18. Gas coals were crushed separately, the size distribution of blends containing separately crushed gas coals in table 2. Under normal operating conditions (when components of all blends are crushed together) the output of the hammer mill was about 170 ton/hr with separate crushing of gas coals. This output can be increased to 495 ton/hr; moreover, the dust content of the blend can be decreased from 60-65% to about 45%. There are 3 tables and 5 references, all of which are Slavic.

AUTHOR	TUMARKIN L.A.		
TITLE	On a universal metric space for compacta.		
PERIODICAL	Vestnik Moskovsk. Univ. <u>11</u> , No.2 (Ser.fiz.-mat. estestv.Nauk No.1) 15-19 (1956) reviewed 12/1956		

In the present paper it is proved that there exists no compact metric space which contains the isometric image of every compact metric space of diameter d ($d > 0$). Several problems relative to the universal spaces are established, e.g.: It must be decided whether for all metric, at most n -dimensional spaces with countable basis there exists a universal metric finite-dimensional space with a countable basis.

TITLE: On the Infinitely Dimensional Cantorian (rects: Cantorian) Manifolds (O beskonechnomernyykh kantorovykh mnogoobraznykh)

PERIODICAL: Doklady Akad. nauk SSSR, 1957, Vol. 115, Nr 2, pp. 244-246, (USSR)

ABSTRACT: Reference is made to relevant preliminary works. The author generalizes the conception of the Cantorian manifold to infinitely dimensional compacts. An infinitely dimensional compact is here called an infinitely dimensional Cantorian manifold, when it may not be split up by any finitely dimensional closed sub-set. An infinitely dimensional compact is then and only then an infinitely dimensional Cantorian manifold, when this compact cannot be split up into two closed true sub-sets with a finitely dimensional cross section. A Hilbert parallelepiped, e.g., is an infinitely dimensional Cantorian manifold. It may also be that an infinitely dimensional compact does not contain any infinitely dimensional Cantorian manifold. Thus can be taken in Hilbert's parallelepiped an infinite sequence of cones intersecting themselves in pairs, whose radii converge toward a certain point. In this connection the radii tend toward zero and the dimension number increases indefinitely. In 1926 the author posed the following (hitherto unsolved) problem: Does every infinitely dimensional compact contain finitely dimensional compacts with any number of dimensions. The theorem proved in the present paper has a certain relation to this problem and to the

Card 1/2

On the Infinitely Dimensional Kantorian (recte: Cantorian) Manifolds.20-2-12/62

problem of the existence of an infinitely dimensional Cantorian manifold in an infinitely dimensional compact. This theorem reads as follows: For any infinitely dimensional compact R the following can be stated: a) R either contains finitely dimensional compacta with any number of dimensions, or b) R contains an infinitely dimensional Cantorian manifold. The proof of this theorem is carried out here. There are 6 references, 2 of which are Slavic.

TITLE: On the Decomposition of Spaces Into a Countable Number of Zero-Dimensional Sets

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya I, matematika, mekhanika, 1960, No.1, pp.25-32

TEXT: The author proves the theorem IV: Let R be an infinite-dimensional metric space with a countable base, which is a sum of countably many zero-dimensional sets. Then R can be decomposed into countably many pairwise disjoint zero-dimensional sets so that the union of every finite number of these sets remains zero-dimensional.

The theorems I-III are special cases. The author mentions P.S.Uryson and Yu.M.Smirno. There are 6 references: 3 Soviet, 1 German, 1 American and 1 Japanese.

TITLE: Hydraulic Servosystems with Double Control Actuating
Mechanisms

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Mashino-
stroyeniye, 1958, Nr 7-8, pp 48-59 (USSR)

ABSTRACT: In Fig 1, a pertinent layout illustrating a hydraulic
servosystem with double control actuating mechanism
is given. Its main parameters are: speed characteris-
tic, traction characteristic, velocity-error constant,
traction-error constant, system rigidity and system
dead zone. The speed characteristic is the dependence
of the servomotor speed V on the opening of the valve
 h : $v = f(h)$; the traction characteristic is the de-
pendence of the servomotor force on the opening of
the valve $R = f(h)$; the velocity-error constant is a
derivative of servomotor speed by the valve opening

Card 1/3 $c : c = \frac{\partial v}{\partial h}$; the traction-error constant is a deriva-✓

SOV/145-58-7/8-6/24

Hydraulic Servosystem with Double Control Actuating Mechanisms

tive of servomotor force by the valve opening j : $j = \frac{\partial R}{\partial h}$; the system rigidity is determined by the traction-error constant j when the speed is equal to zero $j_0 = j_v = 0$; the dead zone Δ_1 is the valve displacement from its initial position. Some characteristics of hydraulic servosystems are described in the works by B.L. Korobochkin, "Comparative Estimation of Hydraulic Copying Devices", published in "Stanki i instrument", Nr 10, 1952 [1], and by V.A. Khokhlov, "Speed Characteristics of Hydraulic Actuating Mechanisms with Valve Control", published in "Avtomatika i telemekhanika", Volume XXI, Nr 5, 1955 [2]. The author introduces the following designations: $v = \mu v_0$; $R = \lambda p_0 F$;

$h = \gamma \frac{v_0 F}{\alpha b \sqrt{p_0}}$, where v_0 is the maximum movement speed

of the system; p_0 - maximum pressure applied to the system; F - servomotor working surface; b - valve

Card 2/3

SOV/145-58-7/8-6/24

Hydraulic Servosystem with Double Control Actuating Mechanisms

working perimeter; α - coefficient. The factor μ , λ , and γ express respectively the servomotor speed, its traction force and the valve opening. In that case, characteristics and coefficients of the system will be expressed in the following way: $\mu = f(\gamma)$; $\lambda = f(\gamma)$; $c = s \frac{\partial \mu}{\partial \gamma}$; $j = r \frac{\partial \lambda}{\partial \gamma}$; $\Delta_1 = 1\gamma = 0$, where s , r and l are constant dimensional factors. Having determined relations between different parameters of the system, the author analyzes several individual cases establishing the criterion for selection of a proper layout to meet specific requirements. AUTHOR: Tumarkin, M.B., Candidate of Technical Sciences, Docent

TITLE: The Control of Hydraulic Servo-motor Mechanisms in Tracing Systems (Upravleniye gidravlichesкими ispolnitel'nyimi mekhanizmami sledyashchikh sistem)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, Nr 11, pp 59-65 (USSR)

ABSTRACT: Disputing the significance of an earlier classification proposed by Korobochkin, B.L. published in the symposium "Modern Trends in Production Equipment" (Sovremennyye Napravleniya V Oblasti Tekhnologicheskogo Oborudovaniya) Mashgiz 1957, the Author proposes a classification based on motion control. The controlling organ can act on four control features namely the pressure and return communication with one or the other side of the piston. All possible variants thus reduce to 9 basic schemes shown in Fig.1. Fig.2 shows the same nine variants with their control valves. Most widely used are variants 1 and 9, namely, either pressure and return control of both sides or return

Card 1/4

SOV/122-58-11-11/18

• The Control of Hydraulic Servo-motor Mechanisms in Tracing Systems

control only of one side only. Some attempts by non-Russian authors to judge hydraulic servo-motors by means of electrical analogies are stated to be of limited value. The proper hydraulic criteria of merit are considered individually for each of the nine basic variants. The velocity characteristic of the system is the velocity as a function of the control valve opening. The derivative of this function (or slope of its plot) is the velocity gain of the servo-motor. The load characteristic is the force (or torque) as a function of the control valve opening. Its derivative (or slope) is the load gain of the servo-motor. The stiffness of the system is the load gain at zero velocity. The insensitivity zone is the control valve displacement corresponding to the beginning of motion. The power efficiency of the system is the output power of the servo-motor divided by the minimum required pump input power at maximum rated servo-motor output. To achieve generality, the actual velocity, load and control valve opening are referred to the respective

Card 2/4

SOV/122-58-11-11/18

The Control of Hydraulic Servo-motor Mechanisms in Tracing Systems

rated maximum values by means of non-dimensional coefficients. (μ , λ and x). Each of the quantitative criteria, for each of the nine systems of servo-motor control, is expressed by a formula containing non-dimensional coefficients and constant size factors (namely s , r and l which constitute combinations of the valve orifice coefficient, the length of the control valve port, the rated maximum pressure, the rated maximum velocity and the piston area). The velocity characteristics are plotted in Fig.3; the velocity gains in Fig.4; the load characteristics in Fig.5; the load gains in Fig.6 and the power efficiencies (based on a constant delivery pump supply) in Fig.7. In all derivations, control valve leakages are ignored. This assumption yields infinite stiffness in most systems. System 1 is among the stiffest in both directions of motion. Some systems, including system 9, have an appreciable zone of insensitivity (equation 24). System 1 has a zero insensitivity with an ideal control valve, assumed in

Card 3/4

SOV/122-58-11-11/18

.The Control of Hydraulic Servo-motor Mechanisms in Tracing Systems

all derivations. Various modifications of the basic systems are briefly discussed. General conclusions are drawn about the suitability of systems. Only system 1 answers the requirements of full equivalence in both directions of motion and possesses the highest merits by all criteria. The systematic classification and generalised conclusions about the significant properties of each system can help in the broad analysis and the selection of servo-motor variants in the design stage. There are 7 illustrations including 5 graphs and 7 references of which 4 are Russian and 3 English.

Tumarkin, Mikhail Borisovich

Hydraulic servo drives; structure and kinematics (Gidravlicheskiye sledyashchiye privody; struktura i kinematika) Moscow, Izd-vo "Mashinostroyeniye", 66. 0295 p, illus., biblio. Errata slip inserted. 10,000 copies printed.

TOPIC TAGS: servomechanism, servosystem, slave mechanism, activator, hydraulic servomechanism

PURPOSE AND COVERAGE: Structure and kinematics of hydraulic servodrives is investigated by the structural analysis method taking into account the known and possible relationships between the elements of the servomechanism. On the basis of structural characteristics, a criterion is established for selecting and calculating the most efficient system design. An experimental method for investigating hydraulic servomechanisms that includes direct plotting of their principal characteristics in an oscillogram is presented. The book is intended for workers in designing and planning organizations, research laboratories, and persons working in the fields of hydraulic automation, mechanization, and general automation of machine tools, machines, and technological processes.

TITLE: Two-stage hydraulic tracing systems

PERIODICAL: Stanki i instrument, no.2, 1963, 9-12

TEXT: A general review is made of various existing design and operation principles of hydraulic and electrohydraulic two-stage tracing systems used in modern process control and machine tools. The types of the systems are discussed and the operational advantages of some are pointed out. One system that is recommended for wide application is employed by many Western firms, such as Vickers, Weston, Sanders and others. This system with electric input can be assembled on the unit head principle. The discussion is accompanied by diagrams and equations describing the system operation. There are 4 figures.

TITLE: Hydraulic servomechanism to direct an automatic welding unit along
the weld

PERIODICAL: Svarochnoye proizvodstvo, no. 6, 1962, 28 - 30

TEXT: A hydraulic servomechanism was developed for the automatic motion of a welding unit along a cable (Figure 1). A guide roll, sliding along the cable, registers deviations of the welding torch and transmits them to control valve 4, which reestablishes the correct position of the torch with the aid of pneumatic cylinder 1. To one side the torch moves under the effect of oil supplied under pressure P_1 to the left-hand hollow of the cylinder; to the other side its motion is activated by spring 3. The welding unit moves along the weld on girder guides. The seam can be located parallel or non-parallel to the guides. In the latter case, when the track motion is connected with the turning of the welding torch, the cable must be adjusted with respect to the seam with some correction. The proposed design of the servomechanism can be used in weld-

Card 1/2

A006/A106

ing of long straight or shaped joints. Tests showed stable operation of the mechanism. The motion speed of the system increases with a greater oil pressure. Maximum speed can be attained (up to 1,000 mm/min) at a pressure of $P_0 = 25 \div 30 \text{ kg/cm}^2$. There are 4 figures.

TITLE: Hydraulic constant-flow scanning systems with differential power drive

PERIODICAL: Stanki i instrument, no. 7, 1962, 9-14

TEXT: The discussed scanning systems, in which the pressure is adjusted to the speed and load of servomotion, are used in copy-milling machines of the Odesskiy stankostroitel'nyy zavod im. Kirova (Odessa Machine Tool Plant im. Kirov). They are similar to those used in semiautomatic multicutters of the Magdeburg Firm and copying lathes used by the Loewe and Heiligenstadt firms. The study was conducted because of insufficient published data on such systems. The presented data help determine where it is economical to use constant flow scanning systems, where constant pressure systems should be used or where a combination of both is better; data is also given for calculating the optimum cylinder dimensions, oil pump capacity and valve

AUTHOR: Tumarkin, M.B., Candidate of Technical Sciences
TITLE: Synthesis of methods and the characteristics of control systems for hydraulic actuator mechanisms
PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, no. 2, 1962, 27 - 31

TEXT: The article is an attempt to generalize and systematize the existing and possible methods of control for hydraulic actuators. In the basic system all four elements of the actuator, namely the input and drainage of both chambers are controlled. Other methods of control may be obtained by suppressing some of the elements. This results in simplifications of the circuit and changes in its characteristics, causing a certain loss of capacity. The latter may be, however, restored by the provision of some additional conditions, such as independent supply for the uncontrolled chamber, separate exhaust or reference valve for uncontrolled return, or creation of a constant force on the uncontrolled side. The classifica-

Card 1/3

S/118/62/000/002/003/005

Synthesis of methods and the ...

tion permits forming nine main schemes (classes), each subdivided into groups. It also facilitates the description of the systems with various methods of control by the same static equations of flow, continuity and equilibrium. These equations are quoted in dimensionless form for simplifying the mathematical analysis. The three mentioned equations permit the speed, traction, rigidity and the zone of insensitivity of the system to be deduced. For illustration purposes, the author determines the speed characteristic of the system 1 - 0 in the case of its operation with constant pressure. The solution results in the known characteristic for bilateral control, $\mu = 0.71 \times \sqrt{1 - \lambda}$, where x is the dimensionless opening of the metering valve. The characteristic of the same system working with constant delivery may be determined by taking into account its structural features. The author deduces the following speed characteristic:

$$\mu = \frac{x_0^2 + x^2 - (x_0^2 - x^2 \sqrt{1 + 4x_0 x \lambda})}{2x_0 x}$$

Card 2/3

Synthesis of methods and the ...

S/118/62/000/002/003/005
D221/D301

where x_0 is the symmetrical underlap of the valve which ensures the operation of the system with a constant delivery. The characteristics of servo systems with variable delivery pumps are derived from the same equations. The analysis permits the finding of systems with similar properties provided their analogous structure determines identical characteristics. As an example, the structurally similar systems 8 - 5 and 9 - 5 are considered. The analysis reveals that the latter possesses the same speed characteristic, except that the relationship between the valve opening and the speed of the actuator is reversed. In the case of system 9 - 5, the increase of valve opening produces a drop in the speed, whereas in 8 - 5 this results in speed increase. The advantage of the latter system is the fact that the throttled fluid is returned to the tank, but in the case of 9-5 unit it is fed into the system. This is followed by a comparison of two other cases and provides a proof of the utility of systematization for the choice of arrangement. There are 6 figures.

Osipova, L. N., and S. A. Tumarkin

Tablitsy dlya rascheta toroobraznykh obolochek (Tables for the Design of Toroidal Shells) Moscow, AN SSSR VTs, 1963. 91 p. 2200 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Vychislitel'nyy tsentr.
Resp. Ed.: V. A. Ditkin, Professor; Ed.: I. A. Orlova;
Tech. Ed.: A. I. Korkina.

PURPOSE: The book is intended for designers and structural analysts concerned with designing shell constructions for strength and stability.

COVERAGE: Tables are composed for an asymptotic solution of differential equations of toroidal shells under symmetrical loading (see the article by S. A. Tumarkin in Prikladnaya matematika i mekhanika, v. 23, no. 6, 1959). The tables of generalized Airy functions by L. N. Nosova and S. A. Tumarkin,

Card 1/4
2

Tables for the Design (Cont.)

SOV/6521

published by the Vychislitel'nyy tsentr AN SSSR, 1961, are also used. The tables were computed on the "Strela" high-speed electronic computer; they contribute largely to the simplification of shell design since the asymptotic method offers formulas for maximal stresses, displacements, and other quantities. The tabulated functions and their derivatives are explained and plotted in diagrams. The arrangement and utilization of the tables are discussed and illustrated by examples. The derivation of design formulas is briefly outlined and the general solution of the differential equation of the shell is given by a simple sum, each term of which is a tabulated function. Sample analyses of toroidal shells are presented and some results are given in tabular and graphic form. The authors thank M. A. Rudis, N. N. Perevezentseva, K. S. Il'in, T. V. Firsova, T. V. Mazurova, and V. I. Pasyukova. There are 14 references: 10 Soviet and 4 English.

Shilov, and A.I. Shirshov.

PURPOSE: This book is intended for mathematicians and physicists.

COVERLAGE: The book is Volume IV of the Transactions of the Third All-
Union Mathematical Conference, held in June and July 1956. The
book is divided into two main parts. The first part contains sum-
maries of the papers presented by Soviet scientists in the Con-
ference that were not included in the first two volumes. The
second part contains the text of reports presented to the editor
by non-Soviet scientists. In some cases when the non-Soviet sci-
entist did not submit an op. of his paper to the editor, the title
of the paper is cited and if the paper was printed in a previous
volume, reference is made to the appropriate volume. The papers,
however, are not listed and cover various topics in number theory,
algebra, differential and integral equations, function theory,
functional analysis, probability theory, topology, mathematical
problems of mechanics and physics, computational mathematics,
mathematical logic and the foundations of mathematics, and the
history of mathematics.

TITLE: Chemical anodizing of aluminum

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 95 - 96, abstract
6I604 ("Mashinostr. i energ. Kazakhstana Nauchno-tekhn. sb.", 1961,
no. 5 (15), 66 - 67)

TEXT: In the factory "Aktyubrentgen" instead of electrolytic anodizing,
chemical anodizing of small articles is carried out in a solution of the follow-
ing composition (in g/l): H_3PO_4 50, NaF 4, CrO_3 10. The duration of the process
is 10 minutes. The use of chemical anodizing avoided expensive adaptations for
the hangings of articles and shortened the technological cycle 4 times.

Orig. Pub.	: V sb.: Vospriyatiye svukovykh signalov v razlichn. akust. usloviyakh. M., AN SSSR, 1956, 12-20	
Abstract	: Following determination of the auditory thresholds in silence of 10 healthy subjects, measurements were made of the thresholds to 8 frequencies (from 100 to 7000 cycles per second) while various sounds were applied for 60 minutes. The range of auditory thresholds in silence and in the presence of noise remained within the same limits (3--20 db) in each of the subjects in all of the experiments. The value of the auditory threshold in silence did not determine the value against a background of noise. When a noise was present, the values of

Abstract	:the auditory thresholds in various individuals approximated each other, i.e.; the shift in thresholds was always greater in the subject with the lowest thresholds. In those cases in which the silent thresholds were approximate in value among various individuals, in the presence of noise the thresholds (for the same tones) might vary considerably. Using the mean values of the thresholds (Fletcher) in calculating the magnitude of masking of the pure tones by the noise is inadequate. One must determine the individual limits of the ranges of the auditory thresholds in silence and with a noise present.

TITLE: Investigation of Audibility-Threshold Variation Caused by Varying the
Duration of Application of a Strong Acoustic Irritant
(Issledovaniye izmenchivosti porogov slyshimosti cheloveka v svyazi s
razlichnoy dlitel'nost'yu deystviya sil' ^{zvukovogo} razdrazhatelya)

PERIODICAL: V sb.: Vospriyatiye zvukovykh signalov v razlichn. akust.
usloviyakh. M., AS USSR, 1956, pp 92-101

ABSTRACT: Audibility thresholds of 10 persons within 100-7,000-cps band during
and after the application of a 120-db white noise were measured. It was found
that in both cases (neglecting the period of sensitivity recovery) the spread of
the thresholds measured at an interval of 1 min did not exceed 6 db, and was
independent of the noise application duration or of the threshold absolute value.
